

AIA ORBIT

FROM BUSINESS VISION TO WORKING REALITY

EXPLORE • VALIDATE • BUILD

MEET ORBIT

Ask the system itself.

AIA Orbit: a knowledge copilot for our COBOL core systems. Ask, understand, plan, propose. A person decides.

THE PROBLEM

The rules are locked in old code

Only a few can read it
Business rules live in COBOL programs

7 to 15 days per hard question
Answered by hand, by a small specialist team

Knowledge walks out
Retirements and role changes take it with them

Change is planned in the dark
Impact is found late, after the work has started

THE COST

Slow, risky, dependent

The business waits in a queue, and the change that follows is hard to scope.

7 to 15 days is the COBOL team's estimate of elapsed time, not effort.

ASK

Ask in plain English

No code knowledge needed
Type a question, with no ticket and no queue

Business or Tech view
Business language for owners, full detail for engineers

Answers stream in live
Or switch to a complete answer at once

Next questions suggested
Follow-ups offered after every answer

BUSINESS IMPACT

Answers on demand

Business owners serve themselves, and specialists stop being a help desk.

RULES MADE VISIBLE

The logic becomes readable

Business rules
Plain-language rules drawn from the code

Decision tables
Conditions and outcomes in one grid

Business flow
A diagram of how the process runs

Data dictionary and relationships
Fields, and which programs share what

BUSINESS IMPACT

Rules the business can read

Policy logic is no longer visible only to the people who write COBOL.

SCENARIO WALKTHROUGH

Try a what-if on real logic

Describe a real case
A customer situation, in your own words

Traced step by step
Each condition and result, through the programs

A clear outcome
With the code reference behind each step

Minutes, not days
To be confirmed with AIA's own cases in the pilot

BUSINESS IMPACT

Test a situation first

Understand how a case behaves before it reaches a specialist.

"Minutes" is to be confirmed in the pilot.

TRACEABLE AND SAFE

Answers you can trace

Source citations
Every answer lists the programs behind it

Open the code
See the exact source from any citation

Like, regenerate, improve
Feedback to make the next answer better

Guards built in
Prompt-injection filter, personal-data checks, rate limits

BUSINESS IMPACT

Verifiable, not black-box

Owners and auditors can check any answer back to the code.

IMPACT ANALYSIS

See what a change will touch

Directly, also, downstream
Programs affected, in layers

Impact map
A picture of the ripple from one change

Change impact report
A document to open, review and share

Asked as a change request
Impact appears in Tech view when you ask for a change

BUSINESS IMPACT

Impact before you commit

Scope and risk are seen before the work begins, not after.

REQUIREMENTS AND TESTS

A first draft that matches reality

Functional requirement
Drafted from how the system really behaves

Test scenarios
Derived from the rules and the decision table

Ready to export
Download as documents for the project team

Grounded in the code
Not from memory, and not from a stale document

BUSINESS IMPACT

Better requirements, faster

Teams start from a draft that matches the system, so fewer surprises later.

CODING AGENT

From question to a change proposal

Locates the right place
Even in a program too large to read whole

Writes the change
Grounded in the question and the answer

Compiler-checked
Run through a real COBOL compiler

A person reviews the diff
A side-by-side comparison, and nothing is applied for them

BUSINESS IMPACT

A head start on change

Engineers review a checked proposal instead of starting from a blank file.

BUILT TO RUN

Run it like a service

Sign-in and accounts
Each person has their own space

History and branches
Return to a conversation, or branch an answer

Admin insights
Answer quality, usage and system health

Security monitoring
Injection attempts and personal-data requests are tracked

BUSINESS IMPACT

Managed, measurable

Leaders see usage, quality and risk, not just a chat box.

WHAT IT MEANS FOR AIA

Value for every group

Business owners

Answers on demand, with no queue.

Specialists

Fewer repeat questions, more engineering.

Delivery

Faster change, with less risk.

Risk and audit

A stronger audit trail, traced to code.

WHY NOW

Systems stay. Specialists are scarce.

70%+

of business transactions worldwide are said to run on COBOL (IBM-cited).

≈15%

projected 2026 IT-spend growth for Asia-Pacific life insurers (Celent).

MAS

proposes tighter change-management controls for insurers; 12 months to comply once final.

≈200

hours a month if 100 routine questions at 2 hours each need no specialist. An illustration.

Sources: IBM claim as reported by NextBigFuture (2020); Celent, Asia Pacific Life Insurance IT Pressures and Priorities 2026; MAS consultation (law-firm summaries, still a proposal). The 200 hours is an illustration, to be proven with AIA's own numbers.

LET'S PROVE IT TOGETHER

Just ask Orbit.

A pilot on AIA's own questions and numbers. A person always decides.
